Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

GAZE PROCESSING IN CHIMPANZEES AND HUMANS

Sanae Okamoto-Barth.

9 juni 2005

1. The more the physical distance between a chimpanzee mother and her infant increases the more they are looking at each other.
2. The development of gaze following in human and chimpanzee infants appears to be highly similar, despite some developmental differences in the onset of each "level" of gaze following.
3. The common occurrence of triadic joint attention in human mother-infant relations is lacking in the interaction between an experimenter and a chimpanzee infant.
4. Human adults' expectation of the location of a target stimulus affects their attention to a gaze direction cue from a schematic face in a traditional target-detection task.
5. Although chimpanzees display impressive social intelligence in many aspects of their daily lives, it are only humans who enter into triadic-joint attentional states with conspecifics.
6. More advanced socio-cognitive skills such as a theory of mind develop gradually in human infants but not in chimpanzees.
7. It is not correct to suppose that similar gaze following behavior in humans and apes produces similar brain activation patterns.
8. While chimpanzees and humans use gaze in similar ways, humans may be unique in their propensity to interpret behaviors, including gaze, in a mentalistic fashion.
9. Japanese and German men do not have the same gaze interactions with women.
